with regard to philosophy, a method introduced by Ludwig Wittgenstein and Bertrand Russell which depicts the idea that truth or falsehood of involved declarations can perhaps be evaluated by assessing them in terms of lesser complex, necessary, rational postulations. The primary job of philosophy is thus the clarifying of ideas and speech rather than the generation of speculative systems of theories. This method largely impacted rational positivity and maintained domination in the U.S. and Britain throughout the twentieth century

ANALYTIC PHILOSOPHY: "The group decided to use an approach geared with analytic philosophy, breaking down the components at hand and scrutinizing each one individually."
